

Flat-Sheet and Hollow Fiber Membrane

typically activated using EDC (1-ethyl 3-(3-dimethyl adsorption of reaction constituents on polymer mem-

The HEC-coated hollow fibers were potted into a module using epoxy (6 fibers of 6.4 cm length each).

kinetic measurements. For both flat-sheet and hollow fibers, rate data were acquired for 20 min, when product concentration increased linearly with time.

TABLE 1
Michaelis-Menten Parameters

Membrane	V_{\max} ($\mu\text{mol min}^{-1} \text{g}^{-1}$)	K_m (mmol dm^{-3})	Correlation coefficient (r^2)
MPS ^a	7.46	0.48	0.99
Hollow fiber ^a	17.5	0.69	0.96
Papain in solution (no membrane)	111	1.44	0.98

[REDACTED]

Fig. 9. Effect of denaturant on the EPR spectrum of hollow fiber. (a)—Fiber before urea treatment, (b) and (c)—fiber treated with 1 and 2 mol dm⁻³ urea, respectively. The dashed line indicates the position of the active subpopulation (A) associated with the by α -Fold M_{12} resonance line. Note that with increasing urea this peak is lost and only the denatured subpopulation is
